

ABSTRACT

A mobile-object-function restriction system executes function restriction in a function-limited area, gives benefit in compensation for the executed function restriction, and releases the function restriction in emergency. In the system, a transmitting device (200) transmits, to a mobile-object terminal device (100), mobile-object information including function restriction information, emergency information for releasing function restriction in emergency, and benefit information to give benefit in compensation for the executed function restriction. A receiving unit (10) receives the mobile-object information and stores it to an information storage unit (50). A function restriction unit (60), upon receipt of function start direction issued by a functional means, permits or restricts the execution of the function concerned, with reference to the function restriction information and the emergency information stored in the information storage unit (50). The receiving unit determines and accumulates benefit chosen from the benefit information in compensation for the executed function restriction.
